

Execution Layer Summary

Overview

We have successfully implemented the **Execute** stage of the RecoverAI pipeline. This module connects the intelligent decisions made by our Policy Engine to tangible recovery actions by interfacing with the Razorpay API.

Achievements

1. Execution Engine (`src/executor.js`)

- Developed a Node.js script that pulls cases in the `action_determined` state from the database.
- Integrated the official `razorpay` SDK to interact with test-mode endpoints safely and securely.

2. Automated Interventions

- The engine successfully maps our abstract policy decisions into real-world API requests:
 - **Discounted Payment Links:** When handling abandoned checkouts, the engine calculates a 10% discount and generates a specialized Razorpay Payment Link containing the updated amount and descriptive notes.
 - **Mandate Notifications:** Simulates the workflow of sending a mandate failure notification to prompt the user to re-authenticate or update their payment method.
 - **Promise-to-Pay Tracker:** Processes overdue B2B invoices and adds them to our simulated communication tracker.
 - **Wait & Retry:** Acknowledges automated retries that require no immediate external user action.

3. Execution Run & Audit Trail Update

- Processed a batch of 40 active cases (cases not blocked by cool-off or DND rules).
- Successfully generated test-mode payment links and simulated notifications for these cases.
- Updated the database status to `action_taken` and appended the precise execution logs (including generated Payment Link URLs) to the persistent Audit Trail.

Next Steps

With our end-to-end recovery pipeline now active—from event ingestion down to API execution—we are ready to move to the **Measure / Audit** phase. We will soon build out Notification Channels and a Recovery Dashboard to visualize our recovered revenue.
